Närvärme Småland-Blekinge

Evaluation of short studies

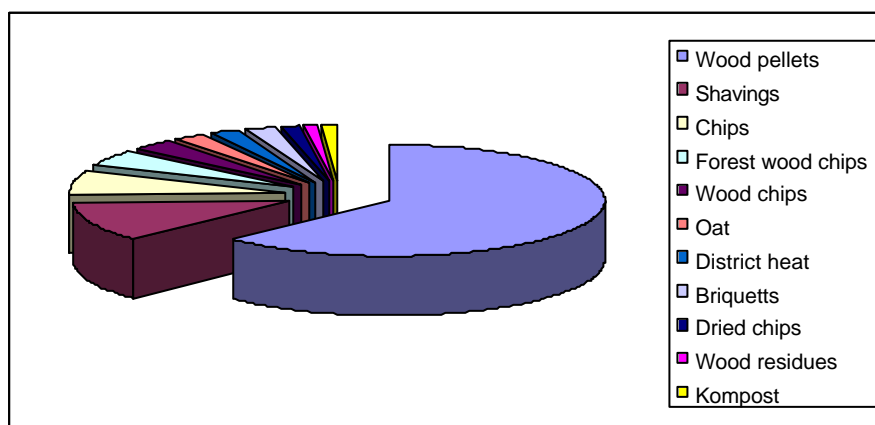

Närvärme Småland-Blekinge (Nearby heating Småland-Blekinge) is a collective term for several initiatives dealing with the "Introduction of bio fuel" in the counties of Småland and Blekinge.

Several short studies with regard to possible biomass usage (nearby heating with biofuel, 0.3-10 MW) were carried out within the scope of Närvärme Småland-Blekinge.

During Summer 2005 Energikontor Sydost made an enquiry on the implementation status of the projects. The results are shown in the diagram below.

The most utilised and recommended respectively biofuel in the projects is wood pellets. Wood pellets have a share of 46 % in the recommended biofuels. In some studies several different biofuels are suggested. Chips of any kind have the second biggest share in suggested biofuels with 12 %.

Altogether 82 studies were carried out on possible nearby heating using biofuels in the regions of Småland and Blekinge. 5 projects have not been implemented, 37 will be implemented within two years, 28 will be realized now or within one year and 16 projects are at final stage. Only 4 % of the projects are non-implemented.
